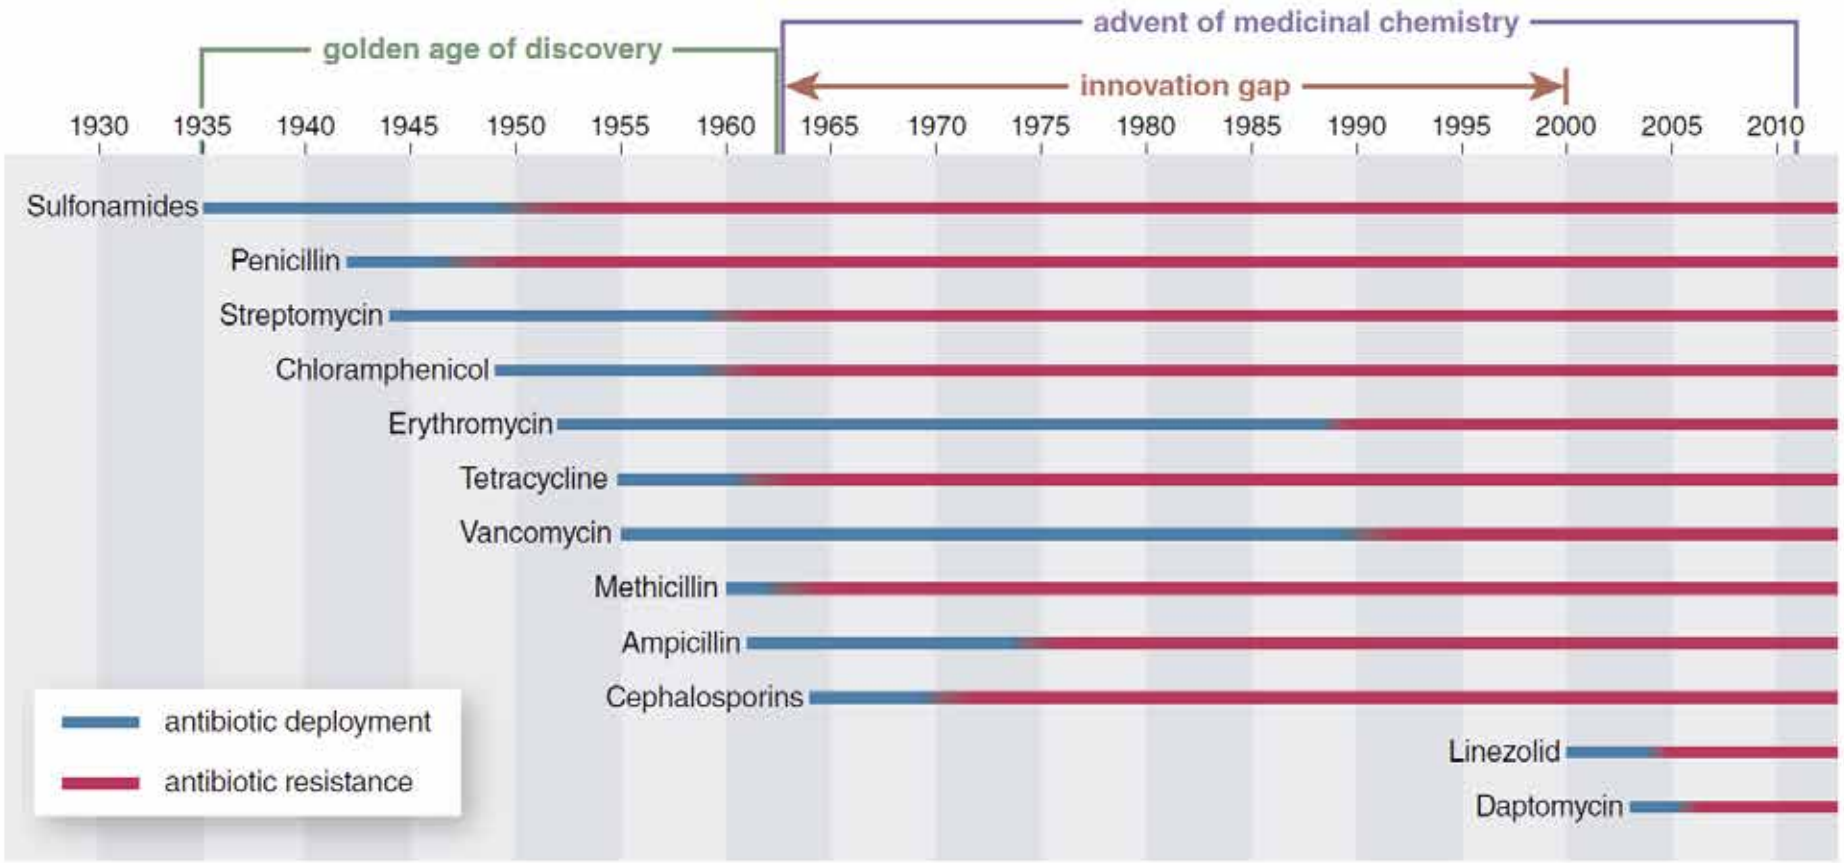
Clinical resistance rapidly follows deployment for ALL antibiotics



Dantas and Sommer, ***American Scientist*** *(2014)*

Treatment of antibiotic resistant infections is an increasing challenge

Antibiotic Resistant Infections Are A Leading Cause of Death

700,000 deaths in 2014

10 Million *estimated* deaths in 2050

(UK Prime Minister's AMR Report, 2014)

Treatment of Antibiotic Resistant Infections Is Expensive

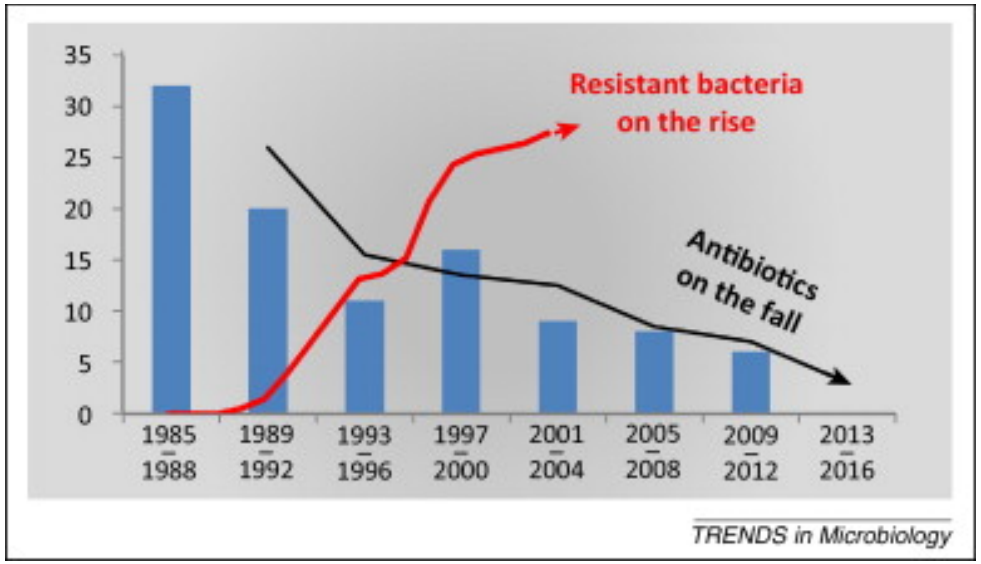
$55 Billion cost to the US economy in 2013

(US CDC, 2013)

$100 Trillion *estimated* cost to global economy by 2050

(UK Prime Minister's AMR Report, 2014)

Resistant Infections Are Increasing BUT New Antibiotic Discovery Is Decreasing



(Tschäberle & Hack, 2014)

Methods for studying antibiotic resistance in microbial communities

KNOWN

CULTURE & PHENOTYPE

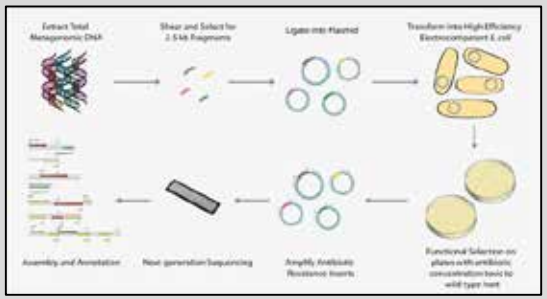
- Clinical resistance levels
- Direct clone to (multidrug) resistance connection
- Culture bias

SHOTGUN METAGENOME SEQUENCING

- No culture bias
- Large sampling depth
- **Only previously identified genes**
- Relative abundance

Known, Readily Cultured
Known, Not Readily Cultured
Unknown

Antibiotic Resistance Reservoir (**RESISTOME**)



FUNCTIONAL METAGENOMIC SELECTIONS

- No culture bias
- Large sampling depth
- **Function confirmed**
- **Can identify novel genes**

UNKNOWN

Functional metagenomic selections identify novel antibiotic resistance genes in microbial communities

But MOST soil resistance genes are novel and co-localized with fewer mobilization genes than pathogens

BUT cryptic soil resistance genes are still clinically-relevant
e.g. tetracycline resistance

- **Two major mechanisms** of tetracycline resistance:
  - Active Efflux **(1)**
  - Ribosomal Protection **(2)**
  - **Both prevalent in pathogens**

- **3rd mechanism**: tetracycline **inactivation**
  - 3 genes from human commensals
  - Tet(X) only characterized enzyme
  - **Not seen in pathogens until 2013**
  - Oxidizes drug via FAD cofactor

- **Drug inactivation** is large clinical threat
  - *e.g.* β-lactamases, acetyltransferases
  - Allows survival of "cheaters"
  - Eliminates drug, energetically favorable

Common Tetracycline Resistance Mechanisms

Target- and Resistance-Based Mechanistic Studies with TP-434, a Novel Fluorocycline Antibiotic

Trudy H. Grossman,[c] Agata L. Starosta,[a] Corey Fyfe,[c] William O'Brien,[c] David M. Rothstein,[c]* Aleksandra Mikolajka,[a] Daniel N. Wilson,[a,b] and Joyce A. Sutcliffe[c]

Gene Center, Department of Biochemistry,[a] and Center for Integrated Protein Science Munich (CiPSM),[b] University of Munich, Germany, and Tetraphase Pharmaceuticals, Inc., Watertown, Massachusetts, USA[c]

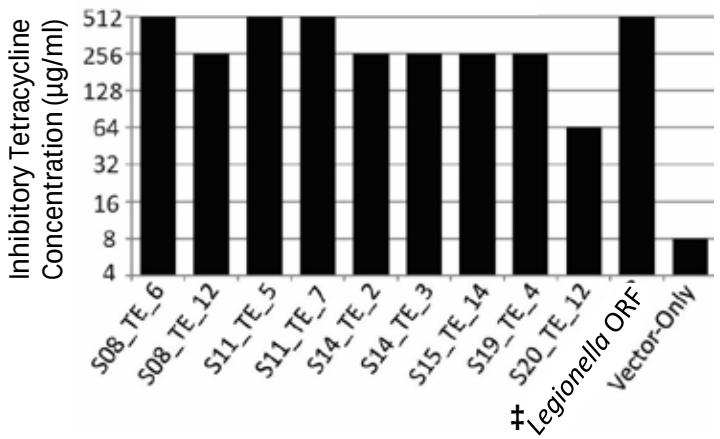
TP-434 is a novel, broad-spectrum fluorocycline antibiotic with activity against bacteria expressing major antibiotic resistance mechanisms, including tetracycline-specific efflux and ribosomal protection. The mechanism of action of TP-434 was assessed using both cell-based and *in vitro* assays. In *Escherichia coli* cells expressing recombinant tetracycline resistance genes, the MIC of TP-434 (0.063 μg/ml) was unaffected by *tet*(M), *tet*(K), and *tet*(B) and increased to 0.25 and 4 μg/ml in the presence of *tet*(A) and *tet*(X), respectively. Tetracycline, in contrast, was significantly less potent (MIC ≥ 128 μg/ml) against *E. coli* cells when any of these resistance mechanisms were present. TP-434 showed potent inhibition in *E. coli in vitro* transcription/translation (50% inhibitory concentration [IC_{50}] = 0.29 ± 0.09 μg/ml) and [^{3}H]tetracycline ribosome-binding competition (IC_{50} = 0.22 ± 0.07 μM) assays. The antibacterial potencies of TP-434 and all other tetracycline class antibiotics tested were reduced by 4- to 16-fold, compared to that of the wild-type control strain, against *Propionibacterium acnes* strains carrying a 16S rRNA mutation, G1058C, a modification that changes the conformation of the primary binding site of tetracycline in the ribosome. Taken together, the findings support the idea that TP-434, like other tetracyclines, binds the ribosome and inhibits protein synthesis and that this activity is largely unaffected by the common tetracycline resistance mechanisms.

NINE new tetracycline inactivating enzymes (*Tet-Destructases*) from SIX soils

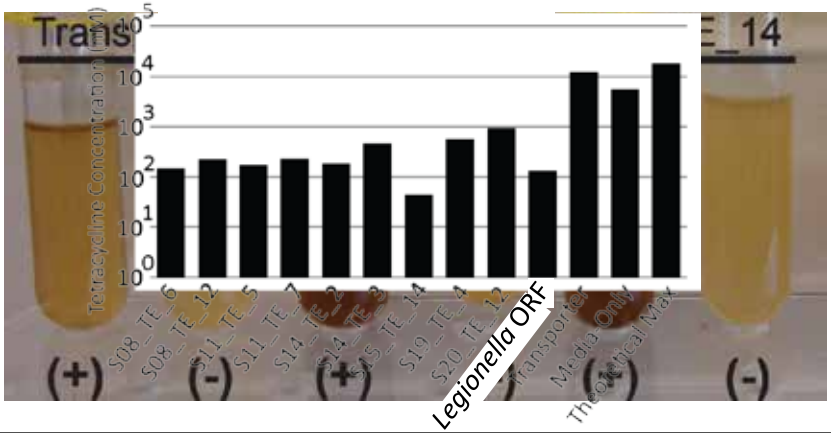
Predicted Function: "*FAD-Dependent Oxidoreductase*"

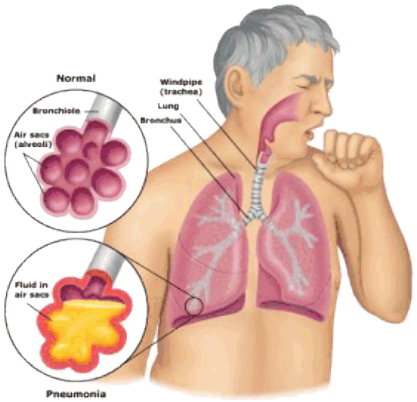
Kevin Forsberg

Sequence unlike any tetracycline resistance gene



Resistance up to 64-fold higher than vector-only control



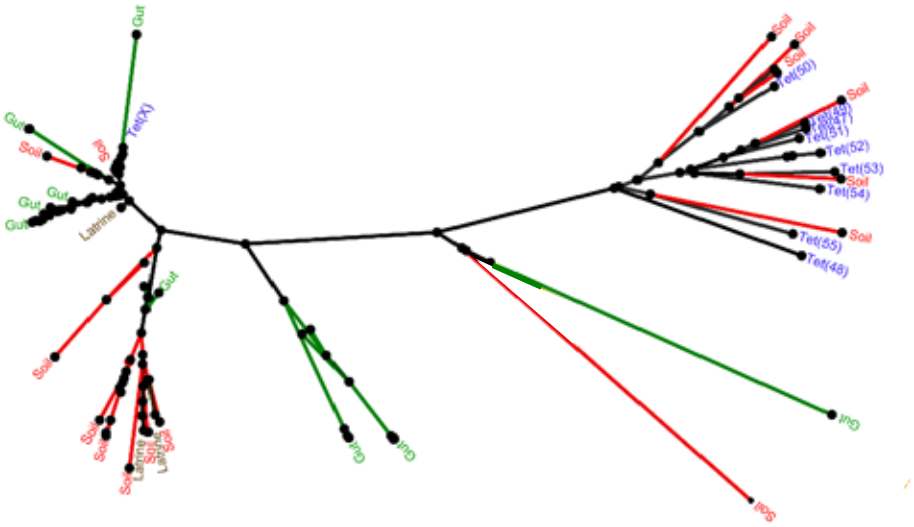


Only homolog from pathogenic *Legionella*‡

Resistance conferred by tetracycline inactivation

Forsberg, Patel, Wencewicz, Dantas. ***Chemistry & Biology****, (2015)*

Tetracycline destructases are widespread in diverse metagenomes and pathogens



Tet(X) identified in MDR pathogens:

E*. faecium*

S*. aureus*

K*. pneumoniae* ***ü*** (Leski *et al.* 2013)

A*. baumanii* ***ü*** (Deng *et al.* 2014)

P*. aeuruginosa* ***ü*** (Leski *et al.* 2013)

E*nterobacter spp.* ***ü*** (Leski *et al.* 2013)

69 additional potential tetracycline destructases were computationally predicted from diverse metagenomes:

- ***Soil***
- ***Gut***
- ***Latrine***
- ***Previously described***

Drew Gasparrini

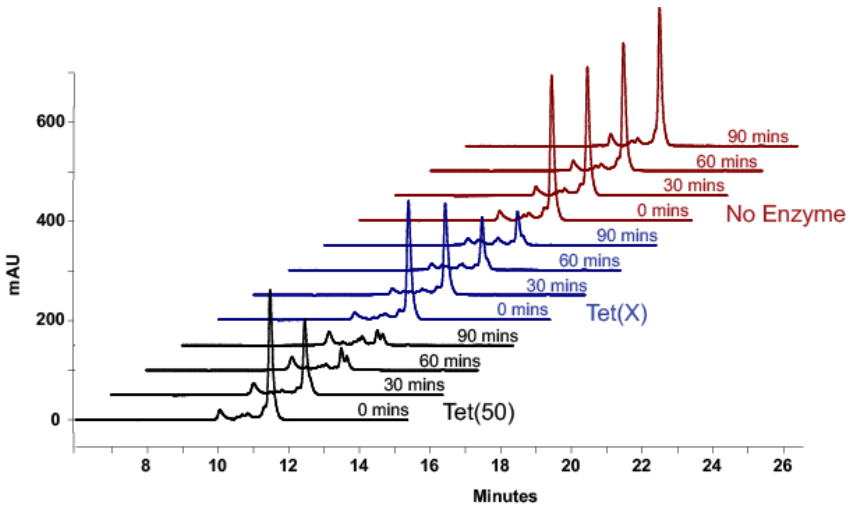
Tetracycline inactivation is an **emerging mechanism** of **clinical resistance** to a **crucial class of drugs!**

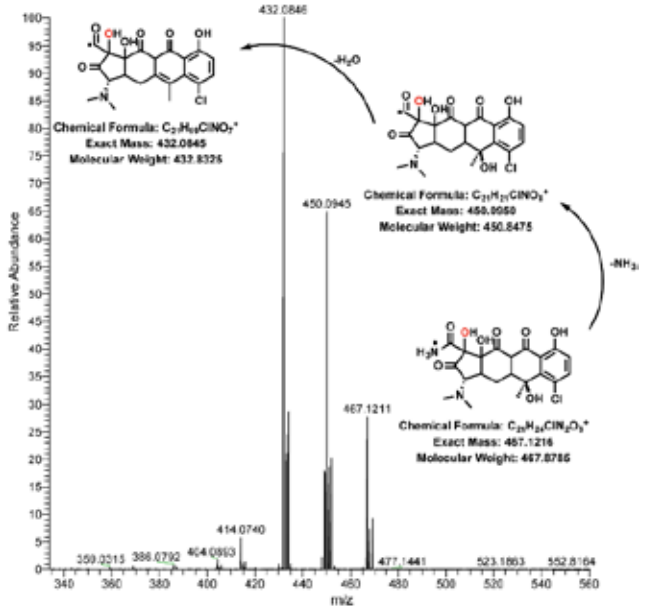
Gasparrini et al., ***unpublished***

Biochemical and structural elucidation of novel mechanism of resistance *(in collaboration with Tim Wencewicz and Niraj Tolia)*

	K_m (μM)	V_{max} (s^{-1})	k_{cat}/K_m ($\mu M^{-1}s^{-1}$)
Tet(56)	7.665 ± 1.630	0.0425 ± 0.002051	0.013862
Tet(50)	16.84 ± 3.555	0.02852 ± 0.001555	0.004234
Tet(55)	4.562 ± 1.684	0.01233 ± 0.0009667	0.006757
Tet(X)	10.77 ± 2.613	0.00448 ± 0.0002618	0.00104

Catalytic efficacy of tetracycline destructases is **4-15 fold greater than only previously described** tetracycline inactivating enzyme





Tetracycline destructases produce **novel decay products** of tetracycline antibiotics, characterized by HPLC, HR-MS/MS

Anhydrotetracycline inhibits tetracycline destructases

Inhibition of antibiotic inactivating enzymes is a powerful tool for combating resistance
